Glossary of Air Quality Terms used in this report:

AQI –	Air Quality Index – standardized EPA method of reporting air quality
BScat –	Beta Scattering - a light scattering unit used for visibility
CO –	Carbon monoxide – An odorless, colorless gaseous pollutant
CO ₂ –	Carbon dioxide – Primary greenhouse gas
CO _{2e} -	Carbon dioxide equivalent – Way to compare other GHG to CO ₂
FF -	Forest Fire or Wildfire
GHG –	Greenhouse Gas
HAPs –	Hazardous Air Pollutant as defined in Title III of the Clean Air Act
MMTCO _{2e} -	Million metric tons of carbon dioxide equivalent
NAAQS –	National Ambient Air Quality Standards – federal air quality standards
NO –	Nitrogen oxide
NO ₂ –	Nitrogen dioxide - a reddish-brown gaseous pollutant.
NOx –	Nitrogen oxides – reddish brown gaseous pollutant - mainly NO and NO ₂
O ₃ –	Ozone – a gaseous pollutant and a component of smog at ground level
PM2.5 –	Particulate Matter 2.5 micrometers in diameter and smaller
PM10 -	Particulate Matter 10 micrometers in diameter and smaller
ppm –	Parts per million - air pollutant concentration.
ppb –	Parts per billion - air pollutant concentration.
SO ₂ –	Sulfur dioxide - a colorless, pungent gaseous pollutant.
SO ₂ –	Sulfur oxides - mainly SO ₂
USG –	Unhealthy for Sensitive Groups – an AQI air quality category
µg/m ³ –	Microgram per meters cubed - air pollutant concentration
VOC –	Volatile Organic Compounds
WAQR –	Wildfire Air Quality Rating - wildfire smoke health internet page
Standard Exceedance –	Occur when the NAAQS is surpassed.
Standard Violation –	The NAAQS provides a cushion which allows for a few exceedances every year. (e.g. the ozone NAAQS is compared to the 4 th highest day of the year. So a city can have three exceedances without a violation.)
Non-Attainment -	An area is non-attainment if its three year average violates the NAAQS and EPA formally declares it non-attainment.

Published by the Department of Environmental Quality, July. 2019

Air Quality Annual Report

DEQ's Mission Statement

The Department of Environmental Quality's (DEQ) mission is to be a leader in restoring, maintaining and enhancing the quality of Oregon's air, land and water.

Each year DEQ updates the annual report including the most recent year. The air pollutants of greatest concern in Oregon are:

- Fine particulate matter (mostly from combustion sources) known as **PM2.5** (2.5 micrometers and smaller diameter)
- **Air Toxics** - pollutants that cause or may cause cancer or other serious health effects.
- Ground-level **ozone**, a component of smog
- **Greenhouse gas** (GHG) emissions and global climate change are also concerns in Oregon. Oregon state agencies track GHG emissions from a wide variety of products, services, utilities, and fuel providers. These emissions data are available on DEQ's web site under Air Quality/AQ Programs / Greenhouse Gas Reporting Home. <http://www.oregon.gov/DEQ/AQ/Pages/Greenhouse-Gas-Inventory-Report>

There is much more information about climate change on the Oregon Global Warming Commission's web page <http://www.keeporegoncool.org/>

Oregon's 2018 Ambient Air Quality in Summary:

- **PM2.5** was greatly elevated in 2018 due to widespread wildfire smoke in August and September. The winter time levels were about average.
- **Air toxics** Some of the air toxics such as benzene and acetaldehyde, remain near or above the ambient benchmarks concentrations. Air toxics in the wildfire smoke were greatly elevated in impacted areas. *Health benchmarks are concentration levels at which, if exposed over a lifetime, an individual's risk of getting cancer is increased by one in a million, or non-cancer health effects could occur.*
- **The ozone** (smog) levels violated the National Ambient Air Quality Standard in most of the communities impacted by wildfire smoke because of ozone precursors in the smoke such as nitrogen dioxide and volatile organic compounds.
- **Carbon monoxide, nitrogen dioxide, sulfur dioxide and PM10** are far below the criteria pollutant federal health standard. These pollutants have been trending mostly downward for most locations over the last ten years.

Air Quality Index

The Air Quality Index (AQI) is a health index which converts concentrations into health levels. The AQI is updated hourly on EPA, DEQ, and Lane Regional Air Protection Agency (LRAPA)'s websites. The AQI uses index numbers, health levels, and colors to communicate impacts to health (Table 1).

Table 1 Air Quality Index Health Category Descriptors.

Air Quality	AQI	Health Advisory
Good	0-50	No health impacts expected .
Moderate	51-100	Unusually sensitive people should consider reducing prolonged or heavy outdoor exertion.
Unhealthy for Sensitive Groups	101-150	People with heart disease, respiratory disease (such as asthma), older adults, and children should reduce prolonged or heavy exertion. Active healthy adults should also limit prolong outdoor exertion.
Unhealthy	151-200	People with heart disease, respiratory disease (such as asthma), older adults, and children should avoid prolonged or heavy outdoor exertion. Everyone else should reduce prolonged or heavy outdoor exertion.
Very Unhealthy (Alert)	201-300	People with heart disease, respiratory disease (such as asthma), older adults, and children should avoid all physical activity outdoors. Everyone else should avoid prolonged or heavy exertion.

How the AQI is computed

The AQI is computed hourly for PM2.5 and ozone. EPA provides all states with the AQI equation for national uniformity. DEQ and Lane County Regional Air Protection Authority (LRAPA) report the AQI for various cities in Oregon.

Table 2. Air Quality Index Ranges and Episode Stages.

Air Quality Rating	Air Quality Index (AQI)	PM _{2.5} 24-hour Average ($\mu\text{g}/\text{m}^3$)	Ozone 8-hour Average (ppm)
GOOD	0 - 50	0.0 - 12.0	0.000 - 0.054
MODERATE	51 - 100	12.1 - 35.4	0.055 - 0.070
UNHEALTHY FOR SENSITIVE GROUPS	101 - 150	35.5 - 55.4	0.071 - 0.085
UNHEALTHY	151 - 200	55.5 - 150.4	0.086 - 0.105
VERY UNHEALTHY	201 - 300	150.5 - 250.4	0.106 - 0.200
HAZARDOUS	>300	>250.5	>0.200

WF = Wildfire Smoke Impact

USG = Unhealthy for Sensitive Groups

2018 Oregon Air Quality Index by City

The AQI provides a review of the health levels over the past year. The Figures below display the AQI health levels over the past year for all the areas where DEQ and LRAPA monitor air quality. **Note:** A summary of all the AQI days are shown in Appendix G.

Table 3. Figure Key for 2018 Air Quality Index.

Air Quality Trends

Ozone Trends

Ozone is a secondary pollutant formed when there are elevated levels of nitrogen dioxide and volatile organic compounds that undergo chemical reactions in high temperatures, and sunlight. In Oregon, elevated ozone occurs in the summer and can be formed by human-caused pollution from fossil fuel combustion and also by naturally caused pollution from wildfire smoke, which contains NO₂ and VOCs. In 2018, most of the state experienced elevated ozone because the wildfire smoke introduced natural precursors on top of the human-caused emissions. With global warming we expect more fires in the Northwest and higher temperature days; this will result in more elevated ozone days. The graphs below show the air quality trends compared to the National Ambient Air Quality Standard (NAAQS). Data with wildfire contributions are included because it is very difficult to determine if the ozone would have exceeded the NAAQS without the smoke from wildfires.

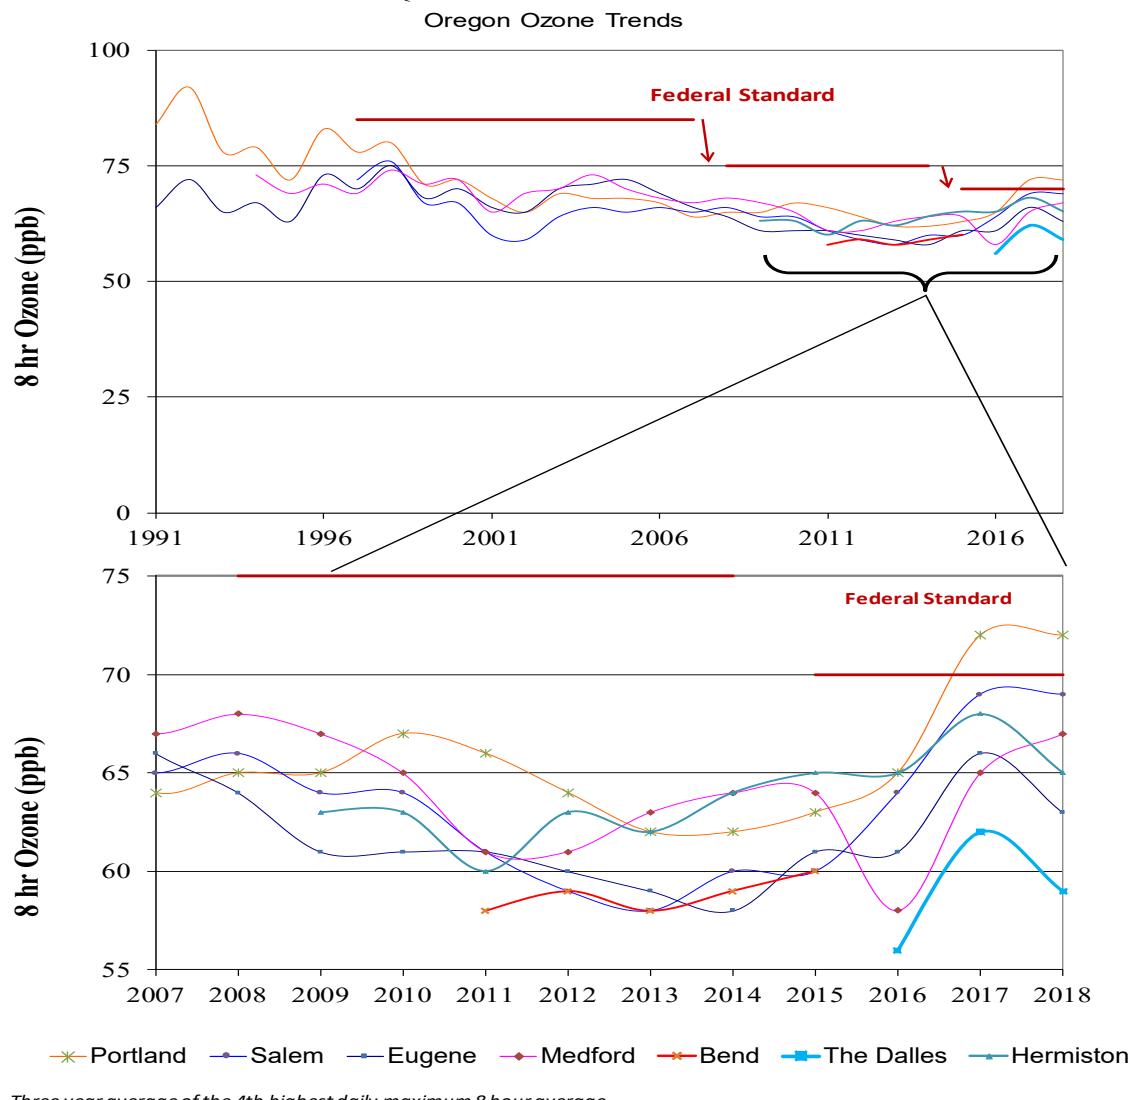

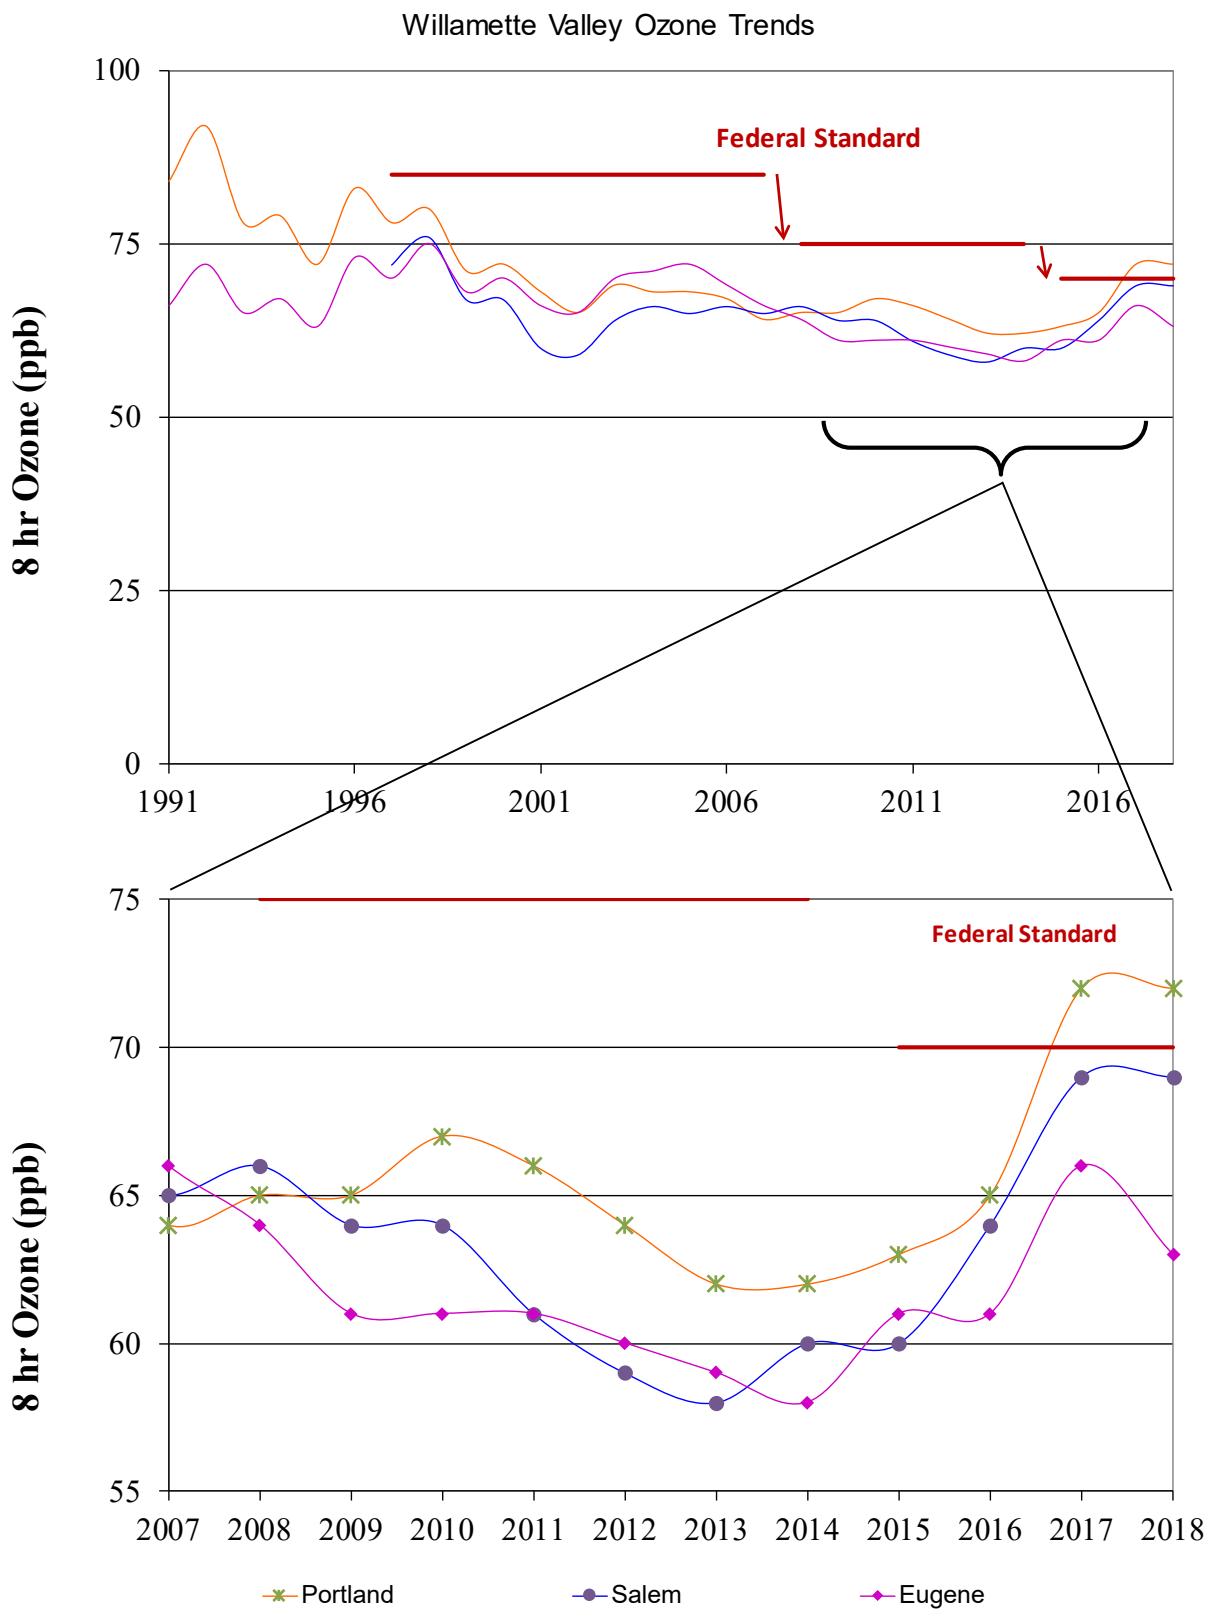

Figure 38. Oregon ozone trend.
For more detail, see the charts by region below.

Three year average of the 4th highest daily maximum 8 hour average

Figure 39. Willamette Valley ozone trends

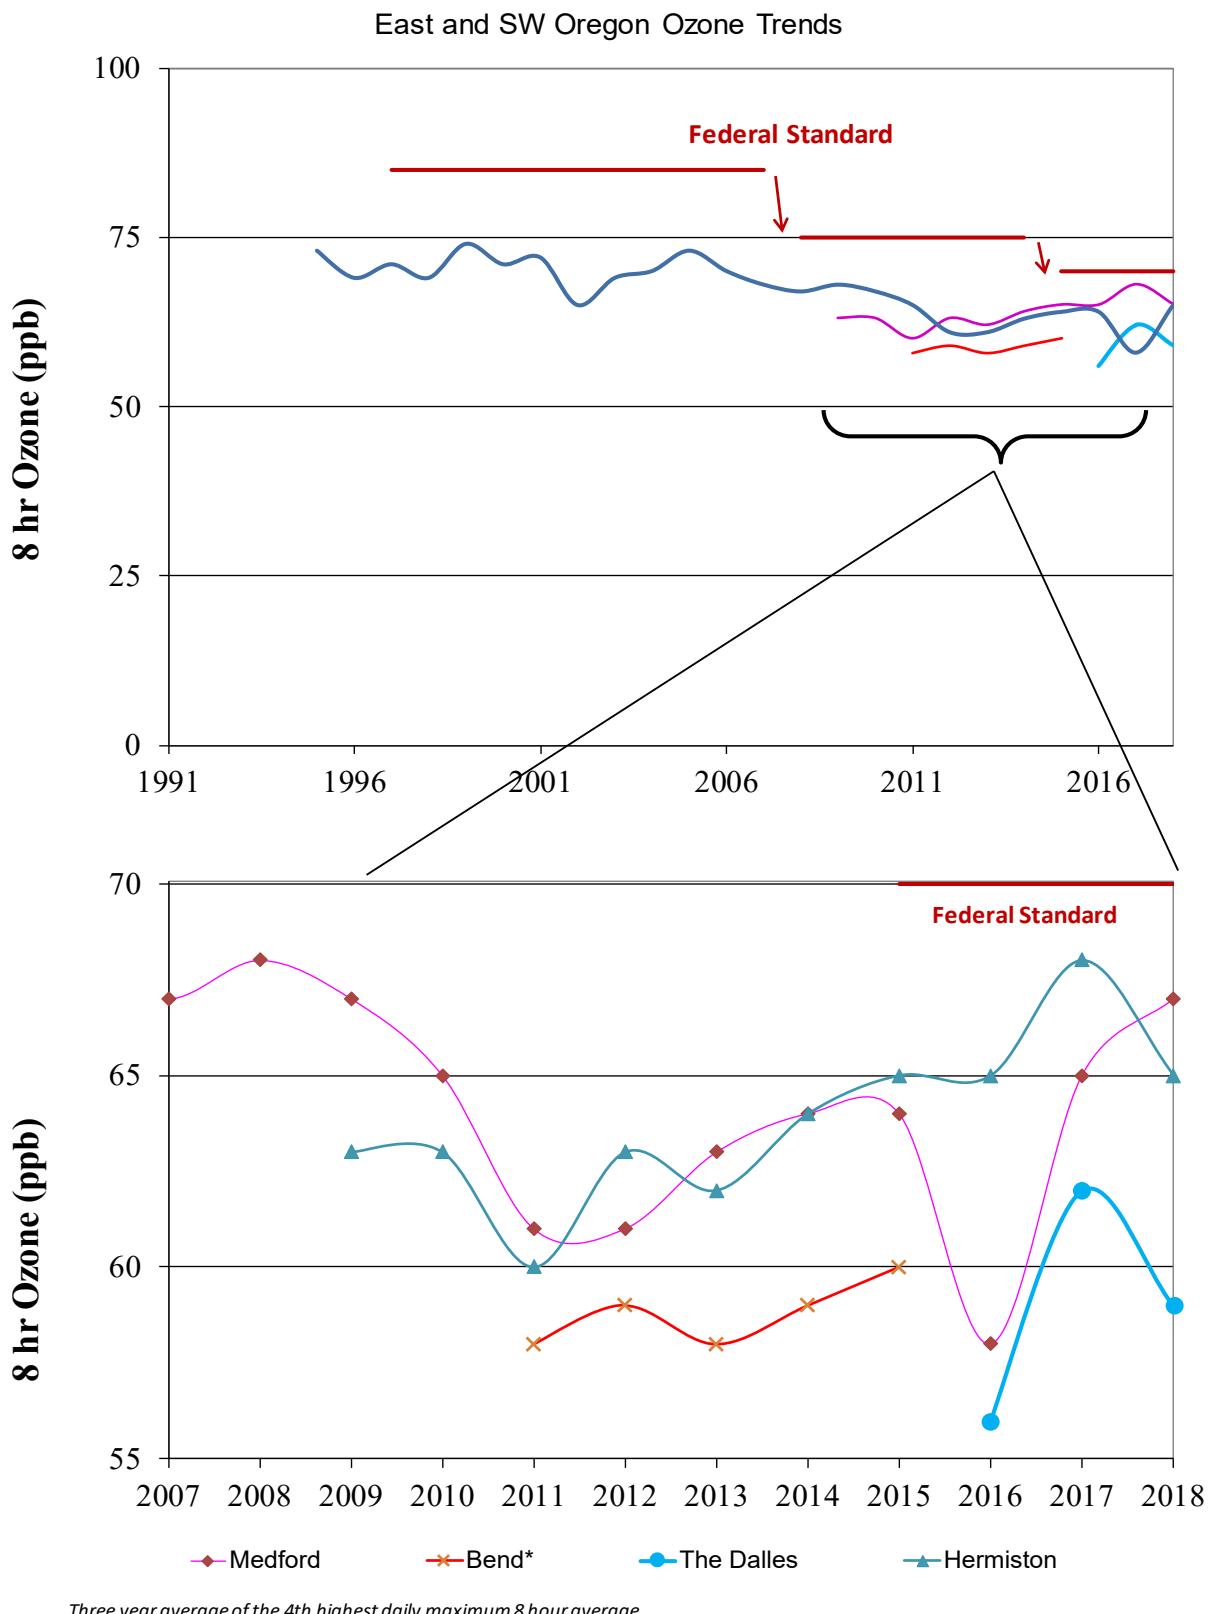

Figure 40. Southwest and Eastern Oregon ozone trends

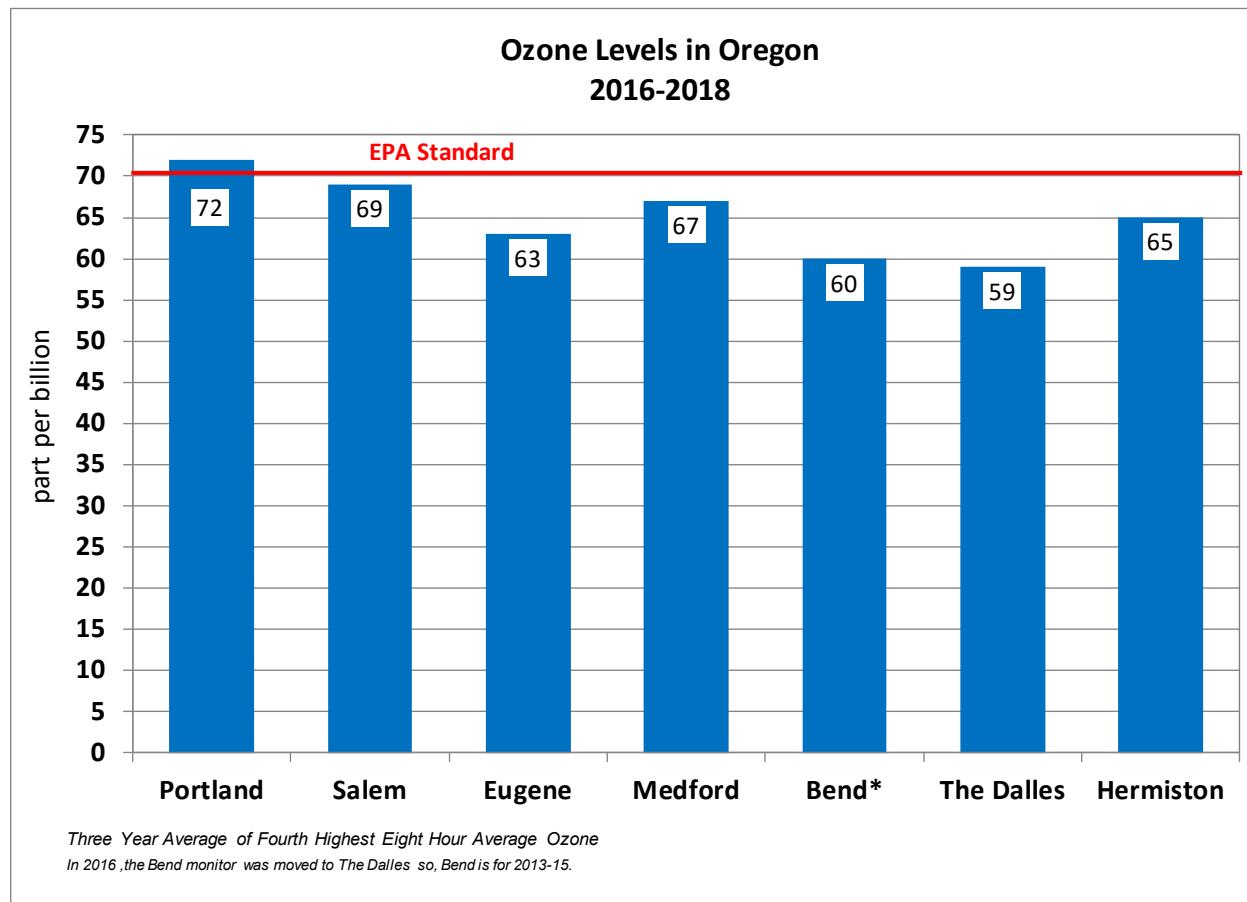

Figure 41. Oregon cities 2016-2018 Ozone Levels

Note that the wildfire smoke in 2017 and 2018 contributed to the elevated ozone levels most likely caused Portland to violate the NAAQS although since high ozone occurs in the summer months precisely when wildfire smoke impacts occur, it is very difficult to determine what the ozone level would have been but for the wildfire smoke.

PM2.5 Trends

The charts below show the trends for the 98th percentile and annual average PM2.5. The 98th Percentile is used for comparison to the daily standard. Wildfire data was separated for daily standard comparison.

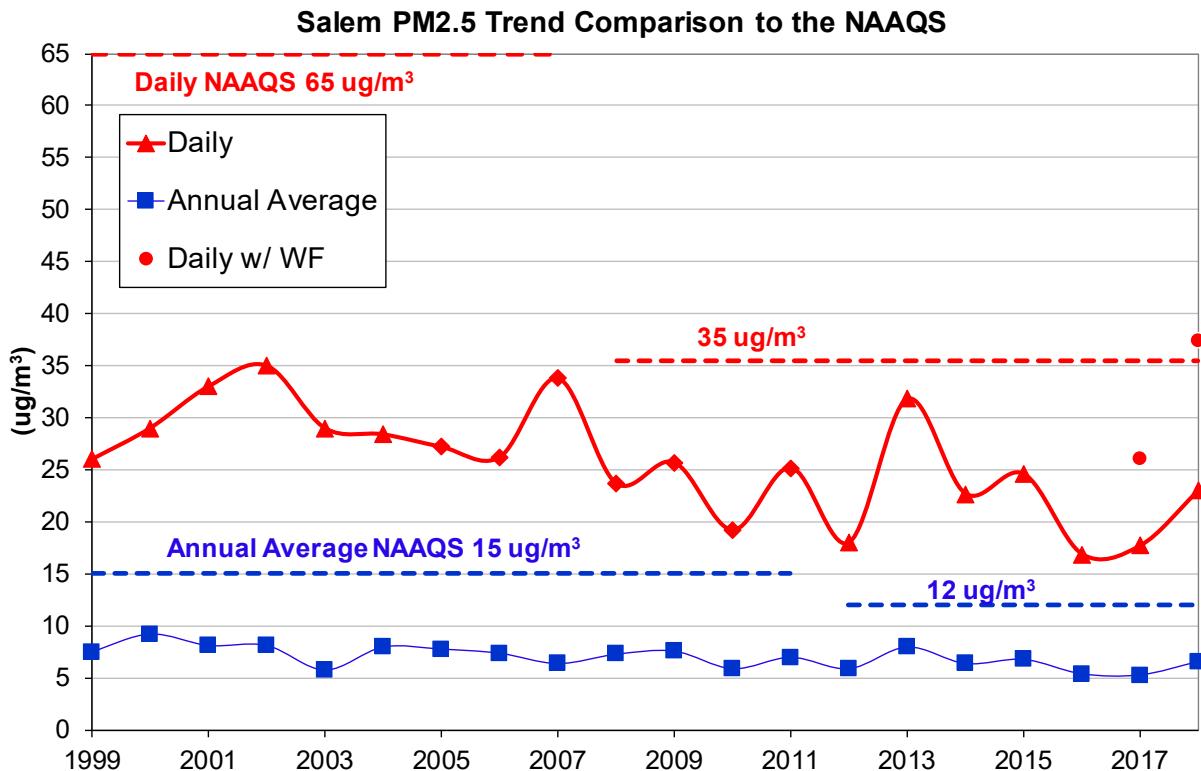

Figure 62. Salem PM2.5 trends.

WF = Wildfire Smoke Impact

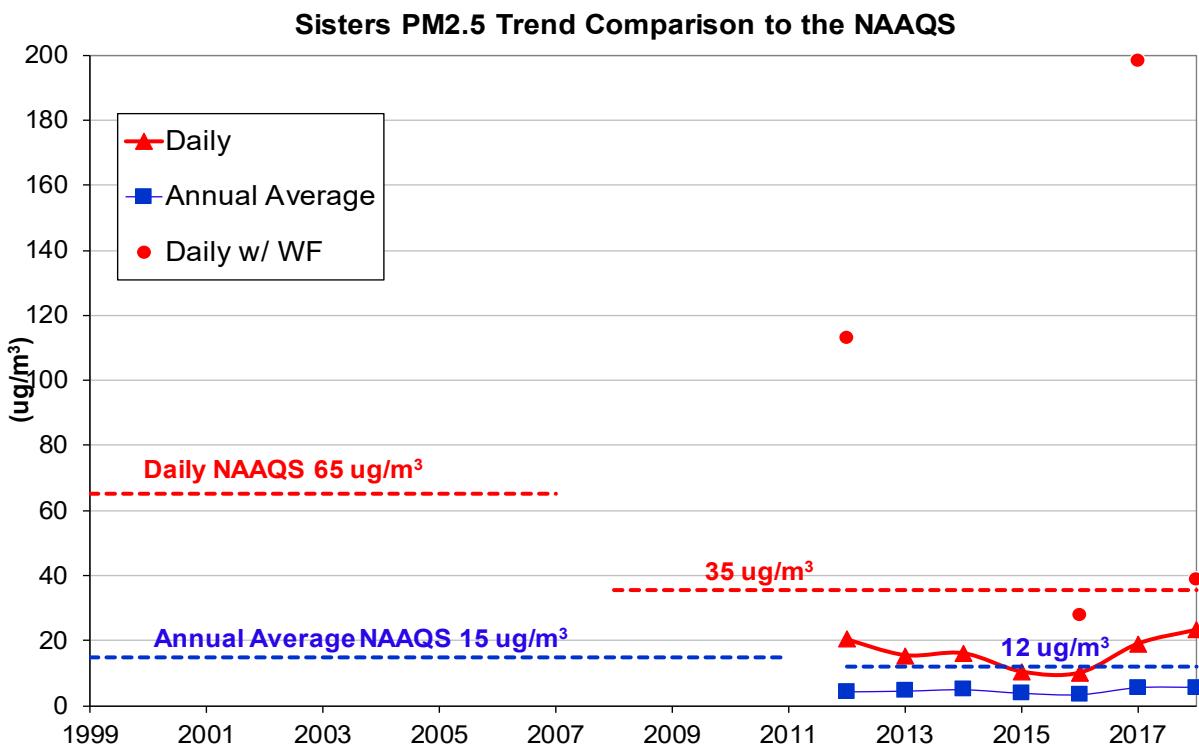

Figure 63. Sisters PM2.5 trends.

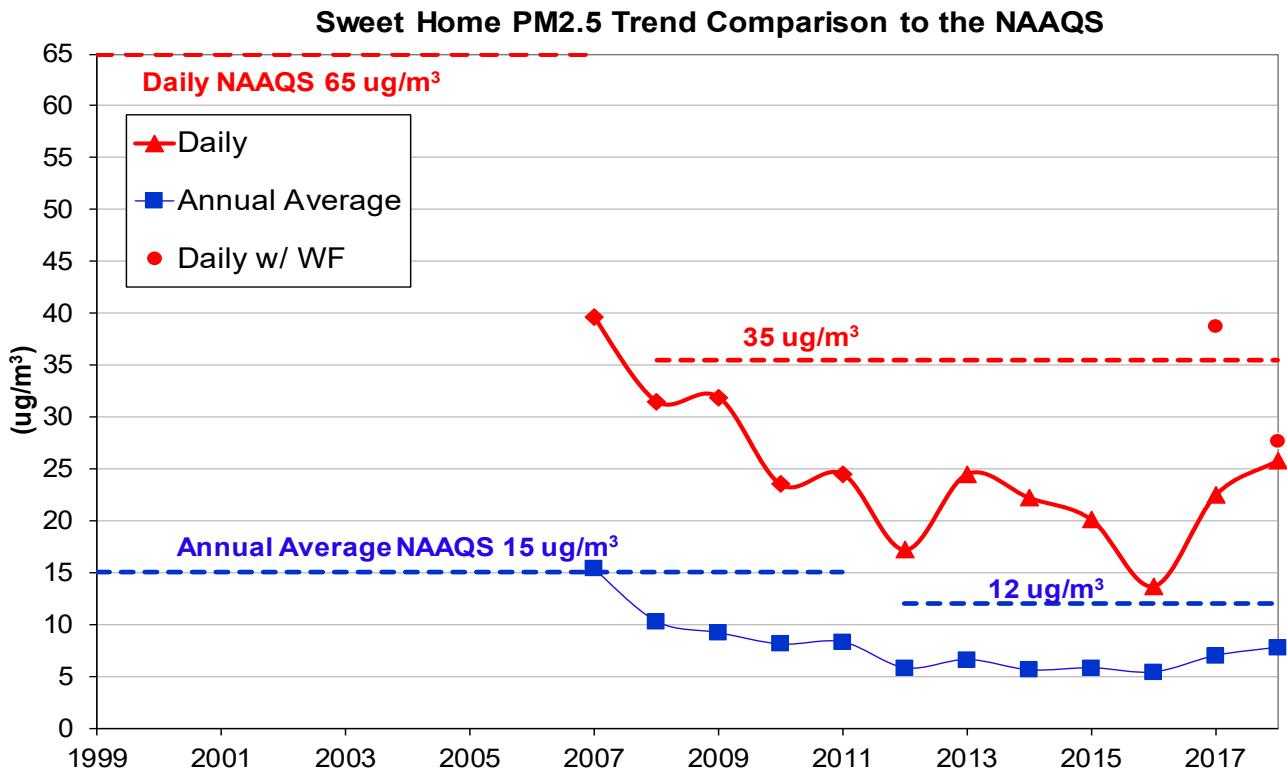

Figure 64. Sweet Home PM2.5 trends.

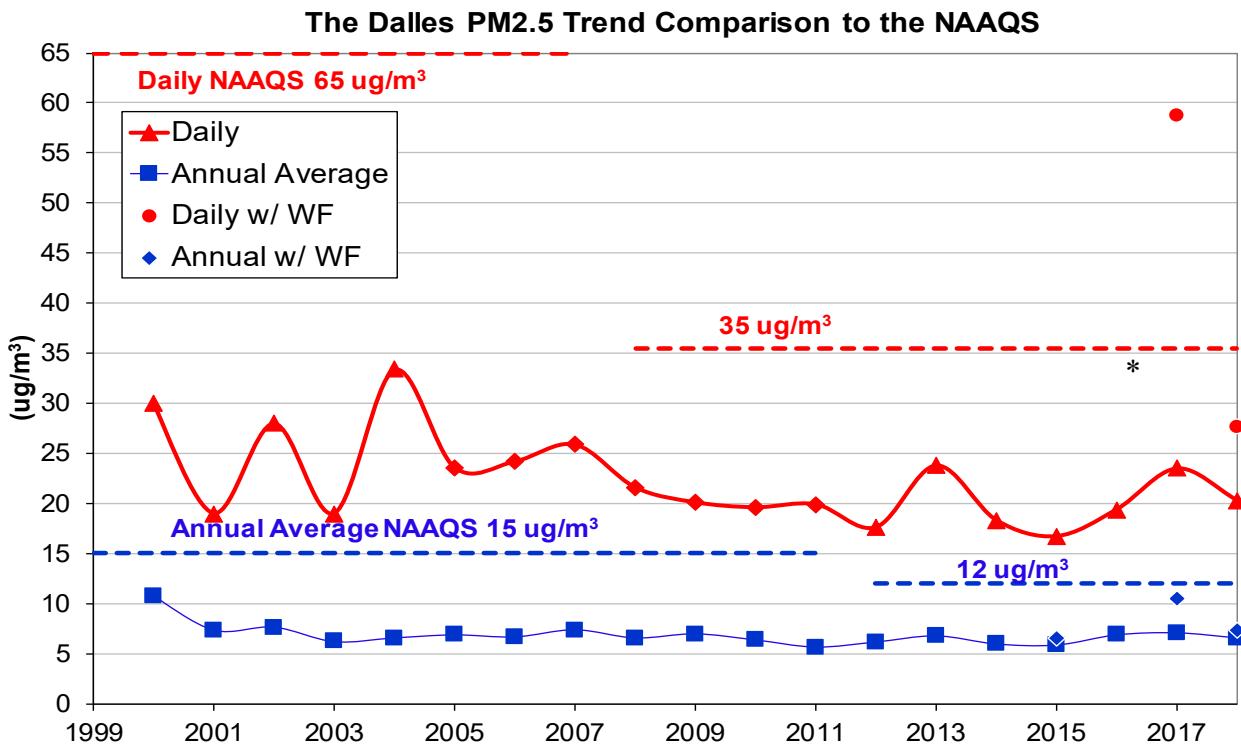

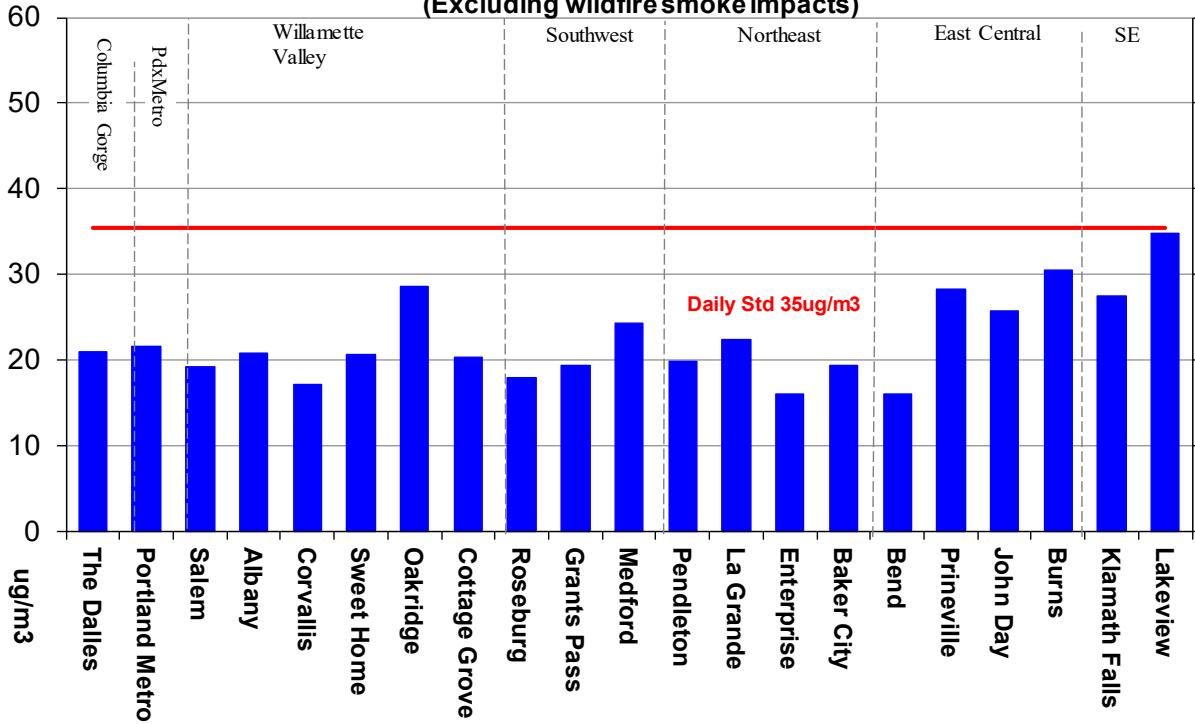

Figure 65. The Dalles PM2.5 trends.

The figures below show the three year average 98th Percentile PM2.5 (daily standard) and annual average PM2.5 (annual standard) levels with and without wildfire smoke impacts. It is useful to understand how much wildfire smoke contributed to raise PM2.5 concentrations above the National Ambient Air Quality Standard and what the levels would be with wildfire emissions excluded. Removing wildfire contributions show the effectiveness of local air quality improvement efforts in communities with PM2.5 reduction plans. Wildfire data would be excluded in determining airshed attainment status because it is considered an exceptional event that cannot be controlled locally.

**2016-2018 Oregon Cities Compared to the New Daily PM2.5 Standard
(Excluding wildfire smoke impacts)**

(Including forest fire smoke impacts)**

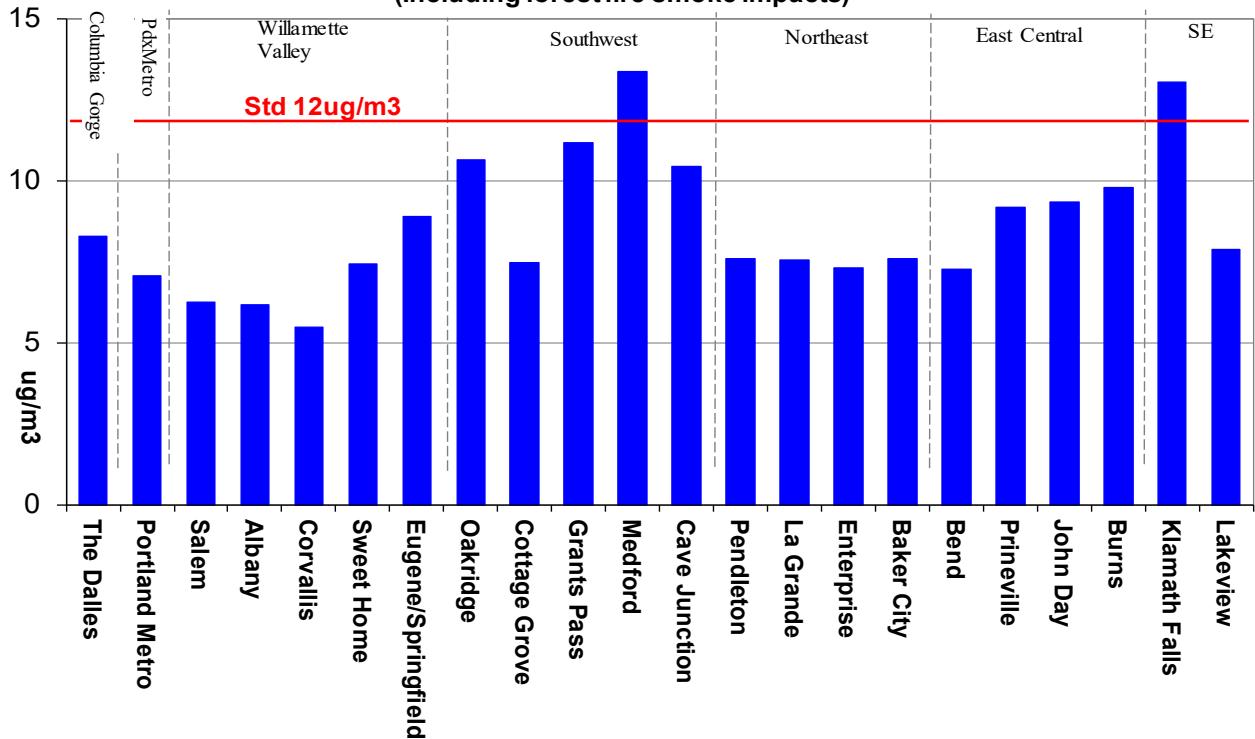

Figure 67. Oregon cities 2016-2018 annual average PM2.5 comparison.
The chart shows the three year average of the annual average with wildfire data included.

PM10 Trends

The PM10 trend chart shows the values in cities with the highest, average, and lowest concentrations. All cities are well below the National Ambient Air Quality Standard.

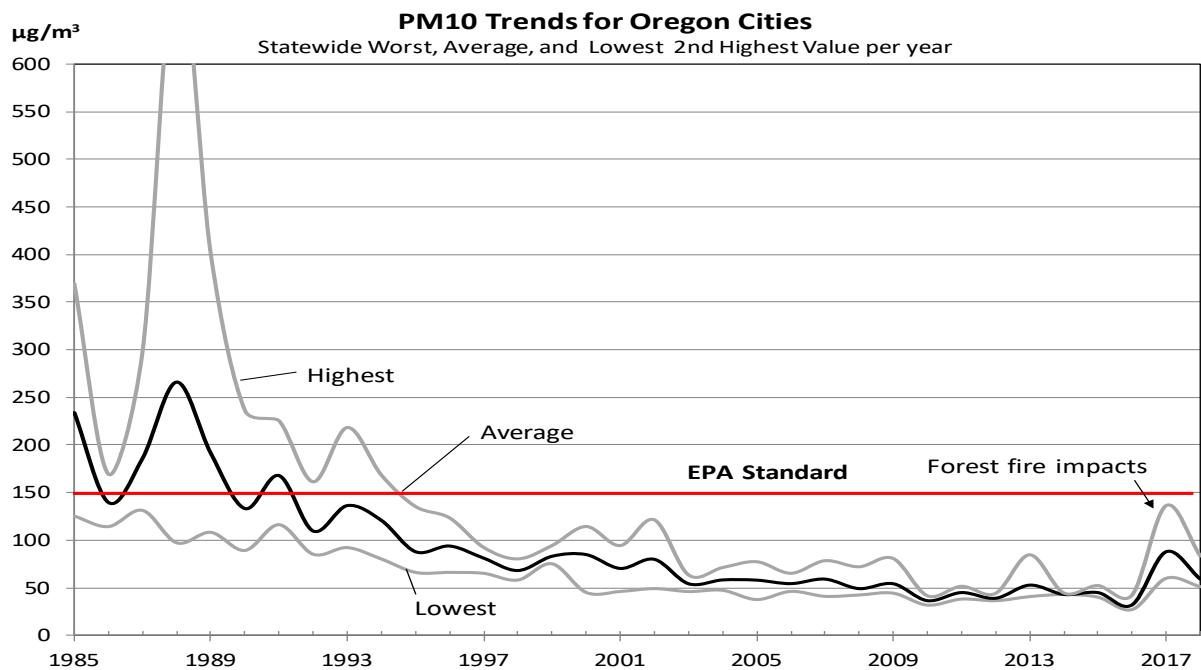

Figure 68. Oregon PM10 trends

Carbon Monoxide Trends

The figure below shows the CO trend in comparison to the National Ambient Air Quality Standard.

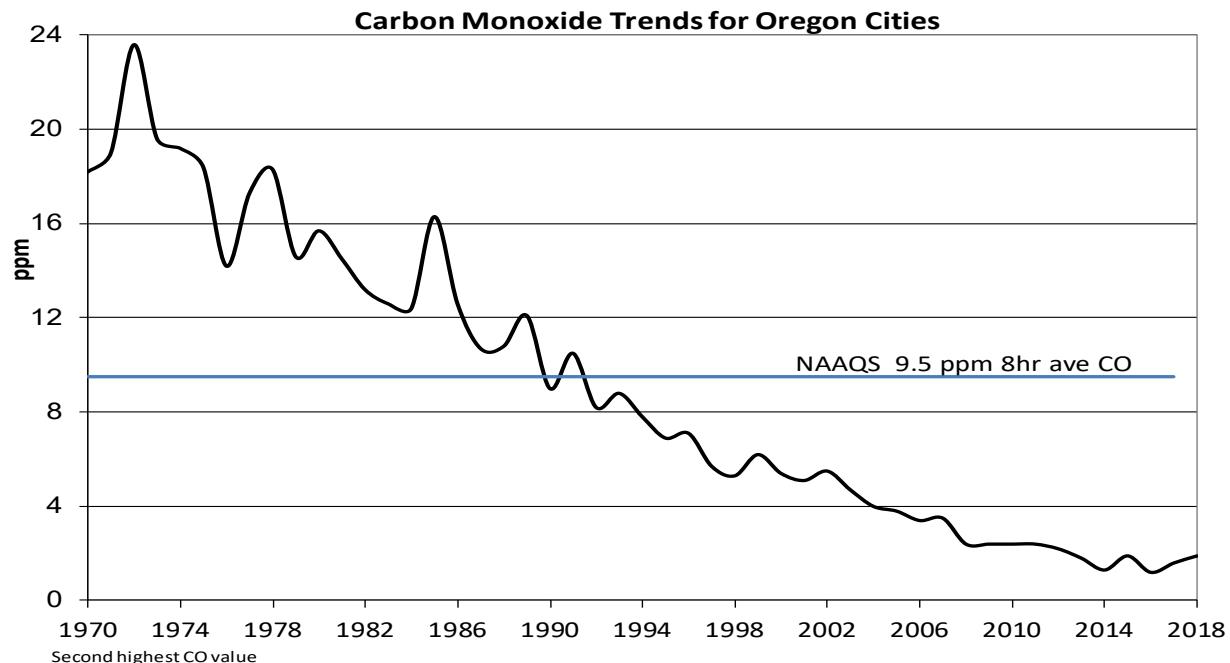

Figure 69. Oregon carbon monoxide Trend.

Trend chart uses the second highest annual, eight hour average.

Sulfur Dioxide Trends

The figure below shows the SO₂ trends in comparison to the federal standard.

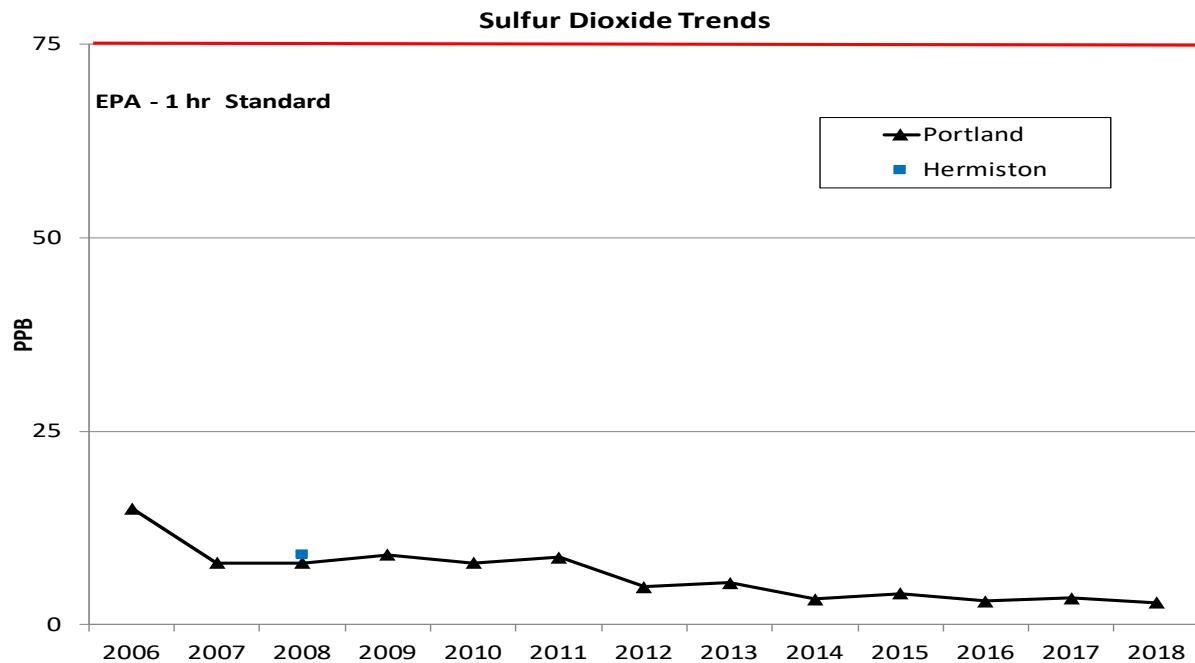

Figure 70. Oregon sulfur dioxide one hour average trends.

Nitrogen Dioxide Trends

The Figure below shows the NO₂ trends in comparison to the federal standard.

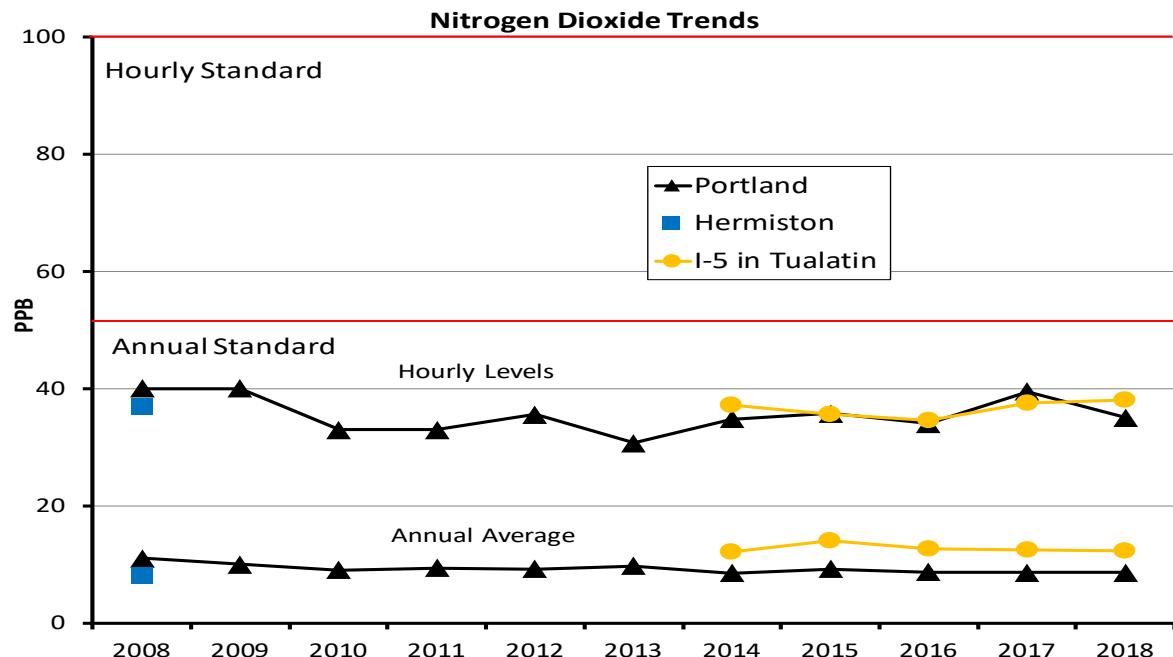

Figure 71. Oregon nitrogen dioxide one hour and annual average trends.

ppb = parts per billion

Air Toxics Trends

Oregon DEQ and LRAPA began sampling for air toxics in Oregon in 1999. The Figures below show the trends for some air toxics of concern. More air toxic information can be found in Appendix H and at EPA's AIRData web site. The values are compared to the Oregon ambient concentration health benchmarks which are the levels where people exposed for a lifetime have an additional one in a million risk of cancer or of experiencing non-cancer health effects.

This information is for neighborhood monitoring only and does not include monitoring next to industrial facilities. That information is presented in separate reports specific to the monitoring project and facility.

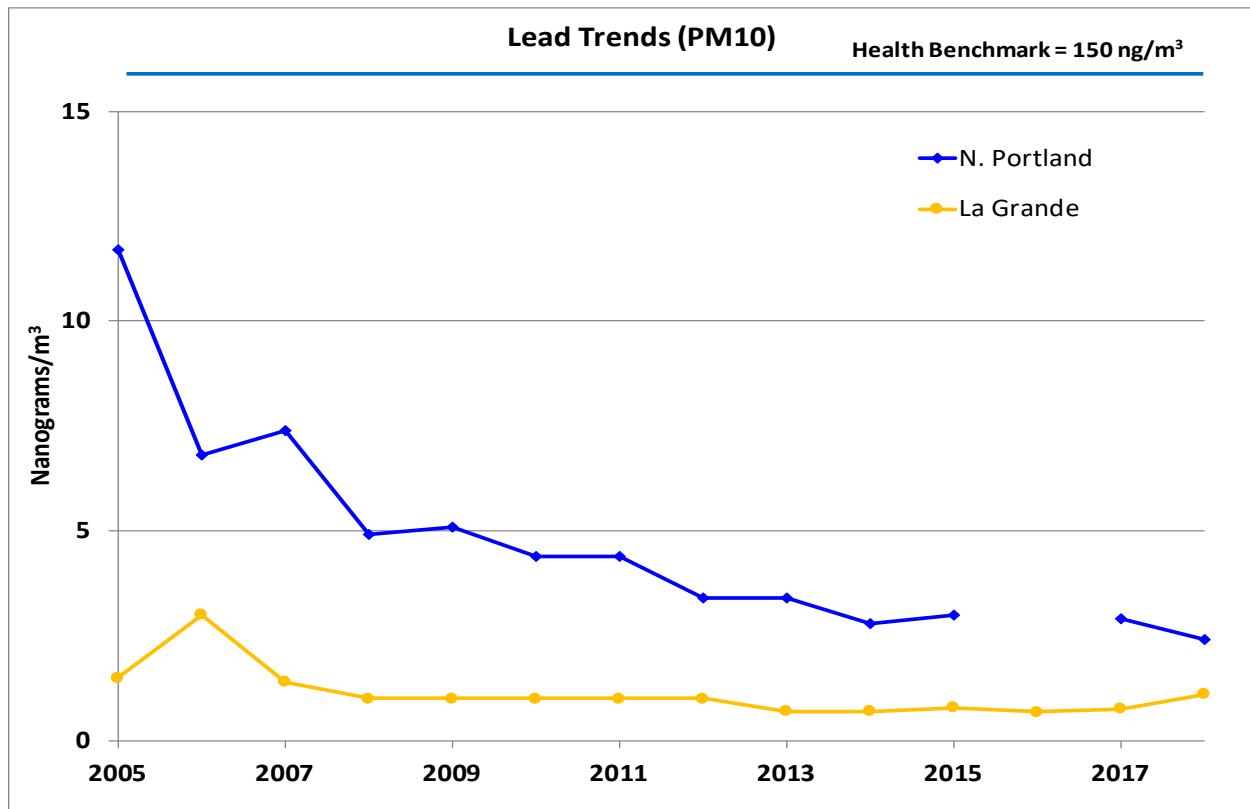

Figure 76. Oregon PM10 lead trends.

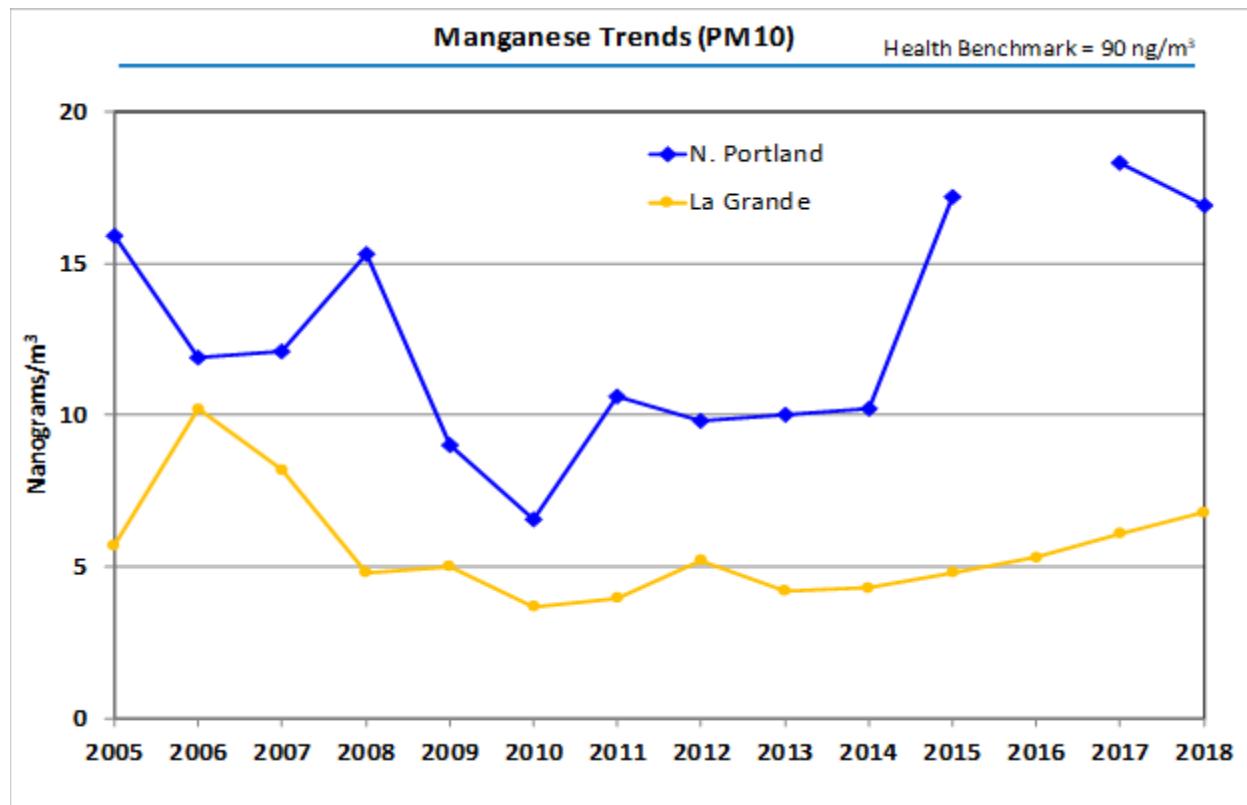

Figure 77. Oregon PM10 manganese trends.

Green House Gas Trends

Green house gas emissions from 1990 to 2014 are presented on DEQ's web page at <http://www.oregon.gov/DEQ/AQ/Pages/Greenhouse-Gas-Inventory-Report>. Some of these trends are shown in the Figures below.

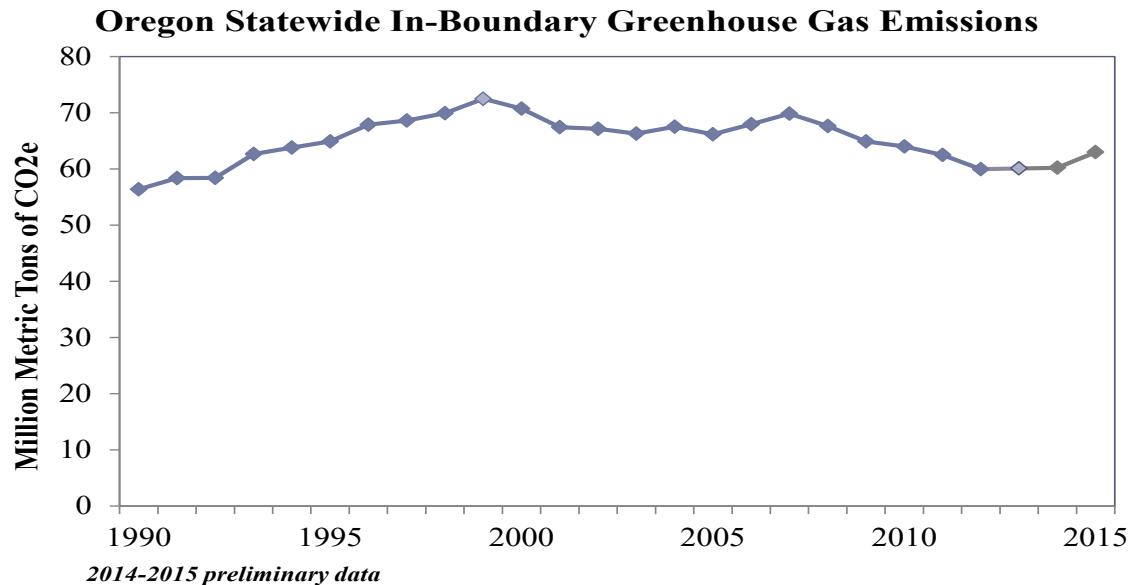

Figure 78. Oregon's total greenhouse gas emissions 1990-2015

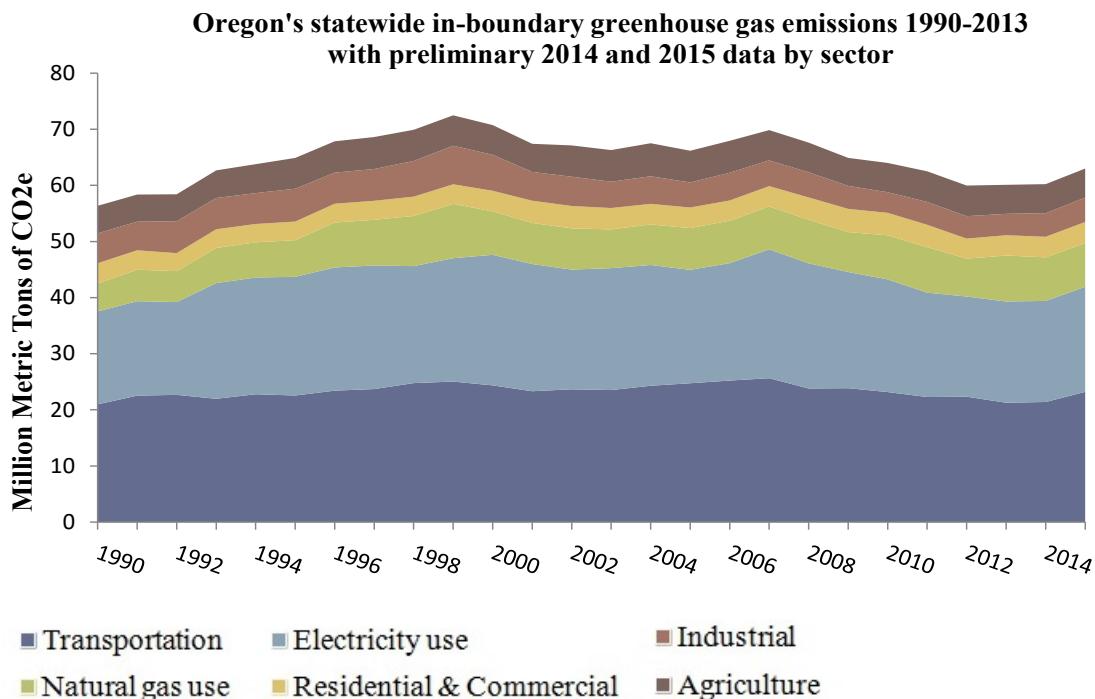

Figure 79. Oregon total greenhouse gas emissions by sector 1990-2015

Oregon's 2013 total greenhouse gas emissions by key sector

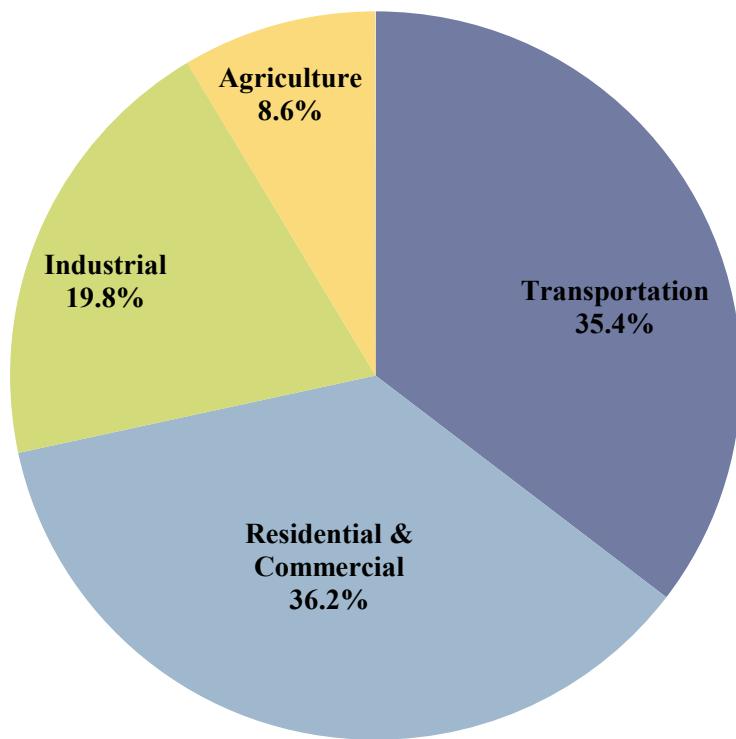

Figure 80. Oregon 2013 total emissions by sector.

National Ambient Air Quality Standards (NAAQS)

The EPA has established primary NAAQS to protect public health and secondary NAAQS to protect public welfare such as agriculture. The following Table has the NAAQS standards for the criteria pollutants. EPA summarizes the NAAQS at: <https://www.epa.gov/criteria-air-pollutants/naaqs-table>

Table 4. 2017 National Ambient Air Quality Standards (NAAQS).

Pollutant	Averaging Time	National Ambient Air Quality Standard (NAAQS) Violation Determination	Primary NAAQS Exceedance Level	Secondary NAAQS Exceedance Level
Carbon monoxide	1-hour	Not to be exceeded more than once/year.	35 ppm	-
	8-hour	Not to be exceeded more than once/year.	9 ppm	-
Lead	Three Months	Rolling 3 Month Average	0.15 µg/m ³	0.15 µg/m ³
Nitrogen dioxide	Annual	Annual arithmetic mean	53 ppb	53 ppb
	1-hour	3yr average of the maximum daily 98 th percentile one hour average.	100 ppb	-
Ozone	8-hour	3-year average of the annual 4th highest daily maximum 8-hour average.	0.070 ppm	0.070 ppm
PM2.5	24-hour	3-year average of the 24 hour average daily 98 th percentile.	35 µg/m ³	35 µg/m ³
	Annual Average	3-year average of the annual arithmetic mean	12 µg/m ³	12 µg/m ³
PM10	24-hour	Not to be exceeded more than once per year on average over 3 years.	150 µg/m ³	150 µg/m ³
Sulfur dioxide	1-hour	3yr average of the maximum daily 99 th percentile one hour average.	75 ppb	-
	3-hour	Not to be exceeded more than once per year.	-	0.5 ppm

Notes: µg/m³ = micrograms of pollutant per cubic meter of air

ppm = parts per million

ppb = parts per billion

Exceedances vs. Violation

Exceedances occur when the NAAQS is surpassed but is not necessarily violated. Violations occur when the standards described in the table above are surpassed. An area can have multiple exceedances without violating the NAAQS. For example, an ozone violation is the three year average of the fourth highest, maximum daily eight hour average. For one year the fourth highest day may exceed the NAAQS but the other two years in the average may be below the NAAQS, bringing the three year average below the NAAQS. During wildfires or other events outside of the control of the community, a violation can be excused by EPA as an exceptional event.

Recent NAAQS Exceedances.

The following Tables summarize Oregon's NAAQS exceedances for the last 10 years for PM2.5, PM10, CO, and Ozone. PM2.5 comparison to the NAAQS is determined by the 98th percentile.

Table 5. PM2.5 98th Percentile – Eastern Oregon.

Year	Bend	Burns	Klamath Falls	La Grande	Lakeview	Pendleton	Prineville	The Dalles

Appendix 1. Data Summaries

Oregon's Air Quality Monitors collect criteria pollutant data using EPA Federal Reference Methods. DEQ and LRAPA use other EPA approved methods for PM2.5 estimates for the AQI, and methods used for air toxics. The criteria data are summarized for comparison to the NAAQS. PM2.5 estimate and ozone AQI data are provided and Air Toxics are compared to Oregon Ambient Benchmark Concentration.

DEQ Air Monitoring Methods:

Appendix 1 -A&B. Particulate (PM10 and PM2.5)

- A. The PM2.5 annual average is determined by averaging the quarterly means.
- B. The PM2.5 maximum daily sample is determined by taking the highest daily sample for the year.
- C. The PM2.5 98th percentile is the value on the 98th percent highest day. (# of days sampled*0.98). E.g. 120 sample days*0.98 = 118; 120 is the highest day, 118th day is the third highest day.
- D. The PM10 maximum daily sample is determined by taking the highest 24 hour sample for the year.
- E. The PM10 2nd highest daily sample is determined by taking the 2nd highest sample for the year.

Appendix 1-C. Ozone (O₃)

- A. Maximum daily, eight hour ozone average is calculated using a rolling eight hour average.
- B. Fourth highest eight hour average is determined from the data in C.

Appendix 1-D. Oxides of Nitrogen (NO₂ and NO)

- A. The one hour value is calculated using the 98th percentile of the maximum daily, hourly average.
- B. The annual standard is determined by averaging the annual one hour values.

Appendix 1-E. Sulfur Dioxide (SO₂)

- A. The one hour value is calculated using the 99th percentile of the maximum daily, hourly average.
- B. The maximum three hour average is calculated using three consecutive hours.

Appendix 1-F. Carbon Monoxide (CO)

- A. Maximum eight hour CO average is determined by calculating an eight hour rolling average.
- B. Second highest eight hour average CO is determined from the data in A. Only one maximum per CO episode is used to count to the second highest.

Appendix 1-G. Air Quality Index based on PM2.5 and ozone

- A. Where there are PM2.5 FRM filter data, that it is used rather than nephelometer data.
- B. Where there is not PM2.5 FRM filter data, nephelometer data is used to estimate PM2.5.
- C. The maximum eight hour average daily ozone is used to calculate the daily ozone AQI.
- D. Where ozone and PM2.5 are both available, the higher AQI of the two is used for the day.

Appendix 1-H. Air Toxics (Hazardous Air Pollution)

- A. Air toxic levels are compared to benchmark levels.
- B. The annual averages are determined by taking the arithmetic mean of the quarterly averages. Where the values are below the minimum detection limit (MDL), the MDL is halved prior to inclusion in the average. If the quarterly average is below the MDL, the MDL is used.

The lists of the Federal Reference Methods and codes are at: <http://www.epa.gov/ttnamti1/>

Table 10. Ambient Air Quality Monitoring Methods

Pollutant	Method Code	Method Description
PM2.5	117, 118, 145	Low volume filter sampler and pre and post filter weighing.
PM10	127	Low volume filter sampler and pre and post filter weighing.
	063	High volume filter sampler and pre and post filter weighing.
PM10 Lead	811	Low volume filter sampler and XRF analysis
Ozone	047, 087	Ultraviolet photometry
NO ₂	590, 186	Chemiluminescent Detection
SO ₂	592	Ultraviolet fluorescence spectrometer
CO	588	Nondispersive infrared trace monitor
Visibility	027	Beta Scattering
PM2.5 Est	027/118, 027/145	Beta Scattering correlated with PM2.5 filter sampling
Air Toxics		
Carbonyls	114	Cartridge-DNPH-Silica-SEP-PAK/ HPLC photodiode Array
Volatile Organic Compounds	078	6L Subambient Canister sampling, GC/MS analysis
Poly Aromatic Hydrocarbon	117	TSP High Volume sampling on PUF/XAD media, Soxhlet Extraction, GCMS analysis.
PM10 Metals	089	High Volume PM10 with ICP/MS analysis on a Quartz Filter
Diesel Particulate	886	Aethalometer (optical absorption) black carbon surrogate

APPENDIX 1H Air Toxics

DEQ analyzes more air toxics than are shown in the table above. Here is list of the main air toxics and some additional compounds not classified as air toxics that DEQ measures. Summary data for all air toxics can be found in EPA's "air data" web site which you can access from EPA AIRNow.

Carbonyl		PAH	
Parameter	CAS #	Parameter	CAS #
Acetaldehyde	75070	Acenaphthene	83329
Benzaldehyde	100527	Acenaphthylene	208968
Butyraldehyde	123728	Anthracene	120127
Crotonaldehyde	123739	Benzo(a)anthracene	56553
Formaldehyde	50000	Benzo(a)pyrene	50328
Heptaldehyde	111717	Benzo(a)pyrene-d12	
Hexaldehyde	66251	Benzo(b)fluoranthene	205992
Isovaleraldehyde	590863	Benzo(e)pyrene	197972
m-Tolualdehyde	620235	Benzo(g,h,i)perylene	191242
o-Tolualdehyde	529204	Benzo(k)fluoranthene	207089
Propionaldehyde	123386	Chrysene	218019
p-Tolualdehyde	104870	Coronene	191071
Valeraldehyde	110623	Dibenz(a,h)anthracene	53703
Metals		Dibenzofuran	132649

Benzene	71432	trans-1,2-Dichloroethene	156605
Benzyl chloride	100447	trans-1,3-Dichloropropene	10061026
Bromodichloromethane	75274	Trichloroethylene	79016
Bromofluorobenzene	460004	Trichlorofluoromethane (Freon 11)	75694
Bromoform	75252	Trichlotrifluoroethane (Freon 113)	76131
Bromomethane	74839	Vinyl chloride	75014

APPENDIX 2 Oregon Ambient Air Monitoring Network

Appendix 2. Oregon Air Quality Monitoring Network

The following tables and map describe the air quality monitoring network.
The following abbreviations are used in the network location tables and maps:

BP	Barometric pressure
CO	Carbon monoxide
DT	Delta temperature (inversion indicator)
HAPS	Air Toxics (Hazardous Air Pollutants)
IMPROVE	EPA visibility program
Lead	Lead sampling
NADP	National Atmospheric Deposition Program
NO ₂	Nitrogen dioxide
O ₃	Ozone
PM2.5	Fine particulate (2.5 microns) based on filter sampling
PM2.5 Estimate	PM2.5 estimate based on light scattering.
PM2.5 Spec	PM2.5 chemically speciated
PM10	Fine particulate (10 micron)
RH	Relative humidity
SO ₂	Sulfur dioxide
SR	Solar radiation
Temp	Temperature
WS/WD	Wind direction and speed

Appendix 3 Data Quality

Quality Assurance

It is a policy of DEQ that all data used by the Department will be of sufficient quality to support the regulatory decisions based upon them. The minimum quality assurance requirements set by EPA are consistently met or exceeded by DEQ.

The continued assurance of data quality requires carrying out the two complimentary tasks discussed below:

Quality Control

The ambient air quality monitoring and sampling done by the Department follows a number of procedures intended to maintain the system within control. Standard operating procedures are documented and followed throughout. Federal Reference or Equivalent Methods are used wherever applicable. Care in using accepted methodology is what makes the Department's air quality data representative and also comparable to the data collected in other states. Routine preventative maintenance and periodic calibrations, using National Institute of Standards Technology gases or other primary standards, are used to achieve a database sufficient in quantity and quality to meet the needs of the Air Quality Program.

Quality Assessment

Evaluations of data quality are made in several ways. At least each quarter, DEQ conducts a system audit in which each sampling and monitoring site is visited to evaluate whether the site location is still appropriate, whether procedures are being followed, and to ensure that documentation is complete. Data quality is assessed in terms of precision, accuracy, and completeness. Precision, or repeatability, is determined by analysis of a known control sample or by replicate analyses. Accuracy, or the ability to measure a "true" value, is assessed by quarterly audits of analyzer performance or sampler flow. DEQ reports these assessments to EPA as summary statistics. Completeness is measured by the amount of data actually captured relative to the amount which ideally could have been collected. EPA also hires independent contractors to evaluate Oregon's sites for accuracy.
